

Task 3: Weather Application using Fetch API

Name: Gaurav Singh

Description:

I developed a Weather Application using JavaScript and the Fetch API to dynamically retrieve and display weather data based on user input. The application allows users to search for a city and view real-time weather information such as temperature, humidity, and weather conditions. It also includes proper loading and error handling for a smooth user experience.

Technologies Used:

- HTML
- CSS
- JavaScript (Fetch API)

Features:

- Search weather by city name
- Fetch real-time data using API
- Display temperature, humidity, and weather condition
- Loading state while fetching data
- Error handling for invalid input or network issues
- Clean and user-friendly UI

Live Website:

https://gaurav7820.github.io/Alfido_Tech_Internship/Task-3-Weather-App/

GitHub Repository:

https://github.com/GAURAV7820/Alfido_Tech_Internship/tree/main/Task-3-Weather-App

API Used:

OpenWeather API (Used to fetch real-time weather data such as temperature, humidity, and weather conditions. The API requires an API key for authentication and data access.)

Steps to Run:

1. Clone or download the repository

2. Navigate to Task-3-Weather-App folder
3. Open index.html in any browser
4. Enter a city name and click search

Code Snippets:

```
<div class="search-box">
  <input type="text" id="city" placeholder="Enter city name...">
  <button onclick="getWeather()">Search</button>
</div>
```

```
const apiKey = "bfee6cadfaf67772b80b06419f51bf0d";

const url = `https://api.openweathermap.org/data/2.5/weather?q=${city}&appid=${apiKey}&units=metric`;

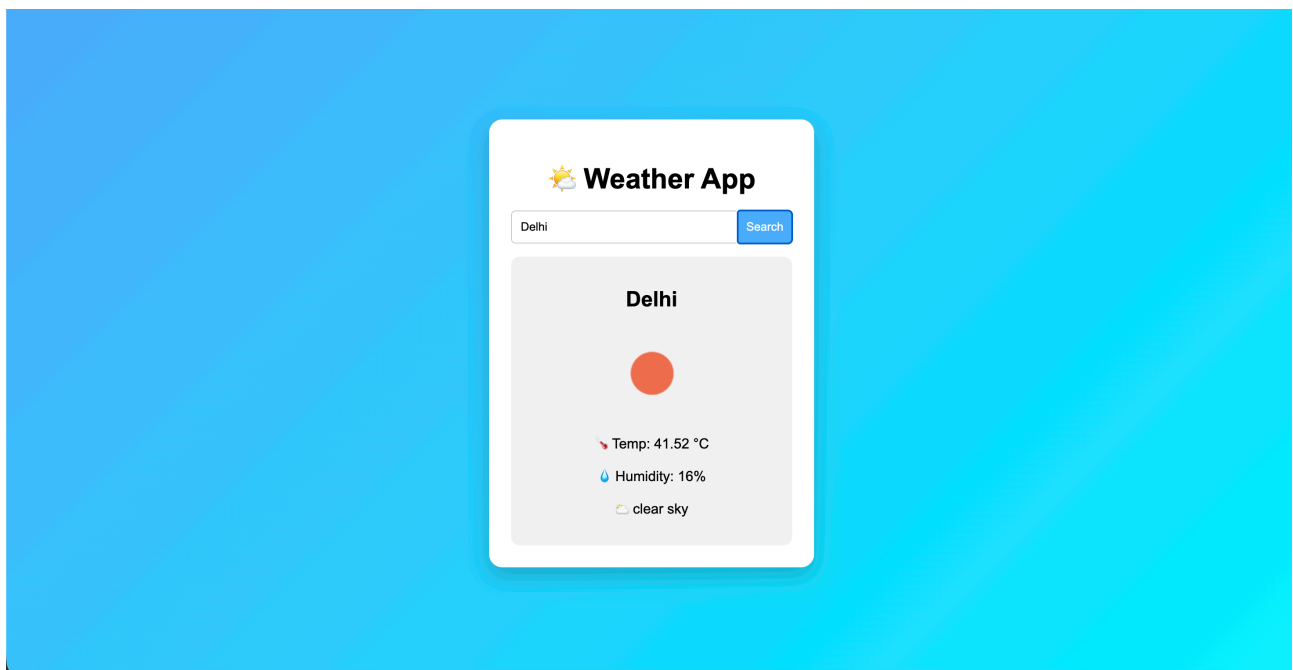

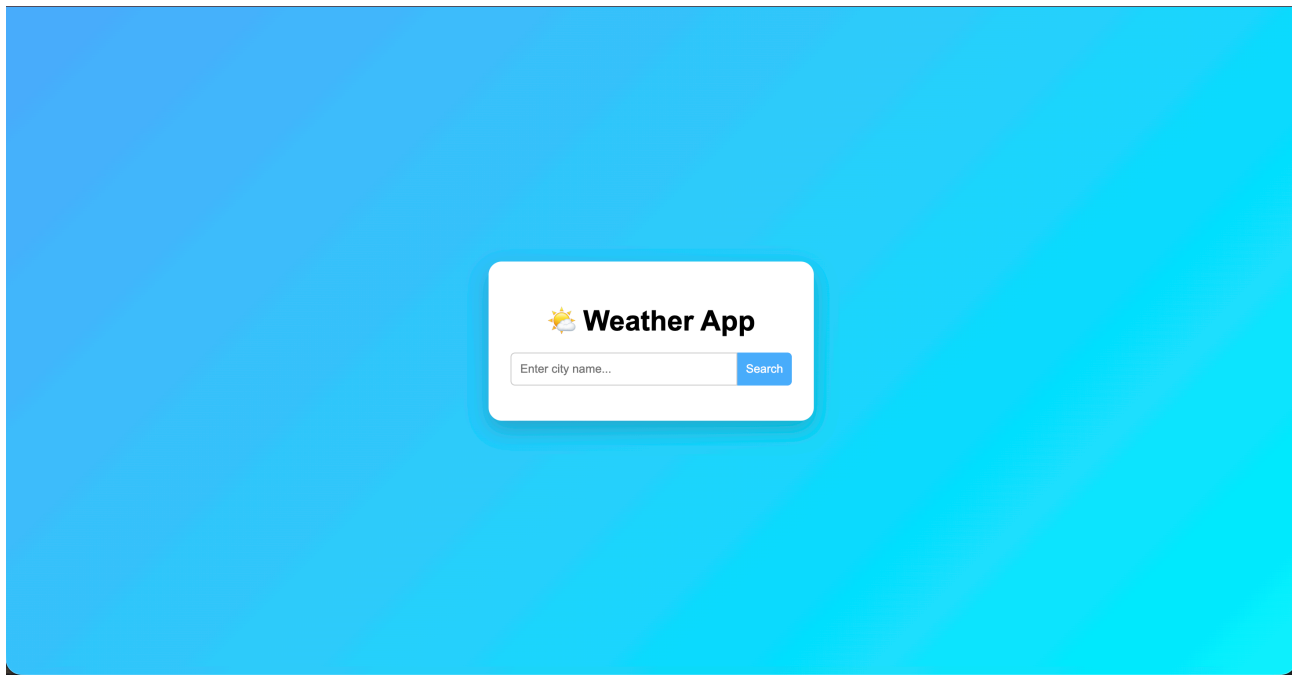

const response = await fetch(url);
const data = await response.json();

if (data.cod === "404") {
  result.innerHTML = "<p class='error'>City not found ❌</p>";
  return;
}
```

Commands Used:

```
git init
git add .
git commit -m "Added Weather App"
git push
```
